The background of the slide features a dark blue, semi-transparent overlay with a pattern of stylized coronavirus particles. Each particle is a sphere with numerous protruding, conical spikes of varying lengths and orientations, creating a textured, three-dimensional effect. The overall color palette is monochromatic, consisting of various shades of blue and teal.

OBJECTIVE

Explore strategies and design solutions that can position health leaders for success in managing COVID-19.

TOPICS

1. Discover new ways health systems are overcoming COVID-19 challenges and preparing for a second wave
2. Gain actionable strategies for managing COVID-19 patients today
3. Identify considerations for resuming outpatient care
4. Learn key policy, strategy and demand considerations for preparing for a Post COVID-19 Healthcare reality

With virus cases soaring, closed hospitals become a precious source of beds

By Rachel Chason and Kyle Swenson

March 27, 2020 at 10:00 a.m. EDT

Covid-19 was exploding in Maryland. Eighty-six reported cases jumped to 108 within 24 hours. Seven days later, there were 581.

If the pandemic continued to pummel Maryland, health experts told Gov. Larry Hogan (R), the state's hospitals would not be able to keep up. Should the worst projections prove true, Maryland would need 6,000 more hospital beds — a 70 percent increase.

Design Parameters for Post COVID 19 Operations

LISA

**FACILITY
CONSIDERATIONS**

**SAFETY/INFECTION
CONTROL**

**EXPERIENCE/
PATIENT & STAFF**

**IMPLEMENTATION
AND IMPACT**

Design Response to COVID | Ambulatory Practices

LISA

Staff Safety Considerations

- Staff based on demand
- Screening/testing protocols
- Provide adequate PPE and protocols
- Articulate dress policy. Provide changing areas and secure, clean space for personal belongings
- Safety huddles
- Social distancing measures
 - Visual cues
 - Eliminate workstations
 - Provide dividers/barriers in shared areas
- Lunch/lounge/meal prep schedule
- Respite/Recharging areas
 - Music, aroma, nature

Facility Considerations

- Ventilation
 - Consult with engineer regarding existing systems, air changes, humidification
- High Touch Surfaces
 - Self-cleaning barriers
 - Cleaning/sanitization policy
 - Touchless hardware
- Elevators (verify feasibility)
 - HEPA filter retrofit
 - Pre-programmed stop
- Toilets
 - Toilet seat lids

Design Response to COVID | Ambulatory Practices

LISA

Pre-Visit Considerations

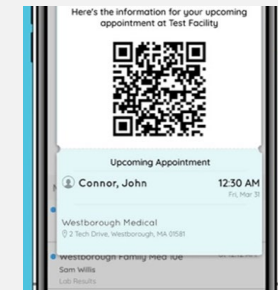

Advance communication

- Implementation of safety measures
- Testing philosophy and policy
- Arrival and intake instructions
- PPE policy
- What to expect during your visit
- Support member policy
- Advance registration and check-in
- "If you are sick" instructions
- Identification of unique patient populations
 - Immune compromised
 - Mobility impaired

On-Site Considerations

- Arrival
 - Wait-in-car if feasible
 - Communication methods
- Screening
 - Thermal scans
 - Temperature/pulse-ox
- Staff Concierge
 - Guidance
 - PPE station/assistance
 - Sanitization of common area
- Waiting
 - Social distancing measures/cues
- Contactless Check-In
 - Technology options
 - EMR module for check-in
 - Touchless kiosk/scanner
- QR codes
- Immediate/self-rooming

Design Response to COVID | Ambulatory Practices

LISA

Examination/Intake

- Vitals in exam room
 - Digital scale
- Hand sanitization/handwashing automation
- PPE
- Supply policy for distribution and storage at point-of-use
- Active and passive infection prevention measures
 - Surface covers
 - Sanitizing computer keyboard or personal device
 - Cleanable products and surfaces
 - UV/Hydrogen peroxide technology
- Trash/hazardous waste disposal process

Check-Out

- In-room
 - Instructions, payment, scheduling, prescriptions
 - Consider printers
- Exiting
 - One-way flow (if feasible)
 - PPE disposal
- Room sanitization

Design Response to COVID | Hospital Based Ambulatory Services

LISA

Facilities Considerations

- Dedicated COVID sites?
- Site and access
- Limit access points
- Specific testing locations on site
- Tent structures

Staff Safety Considerations

- Advance communication of test results
- Communication/shift change protocols

Check Out Our Toolkit

<https://info.array-architects.com/covid19-outpatient-toolkit>

Pre-Visit Considerations*

- Scheduled or emergent processes

On-Site Pre-Visit Considerations*

- Managing the cue/patient on-deck
- Evaluate hours of operation to accommodate volumes
- Patient support member waiting
- Navigation throughout the facility

Examination/Procedure/Testing*

- Patient separation
- Required clinical environment

Check-Out/Departure*

- Discreet egress

* Will need to define policies/procedures for COVID and NON-COVID patient populations

Design Response to COVID | Ambulatory Practices

How COVID-19 Is Shaping the Patient Experience

LISA

An Analysis of 350,000 Patient Comments

How COVID-19 Is Shaping the Patient Experience An Analysis of 350,000 Patient

In a Press Ganey analysis of 350,000 comments from ED and medical March 20, 2020, the number of comments mentioning COVID-19 has grown week from early February through mid-March.

To identify emerging themes and provide insights and recommendations and analyzed the nearly 12,000 COVID-19-related comments, generating leading to the following observations.

Observations from Patients' COVID-19

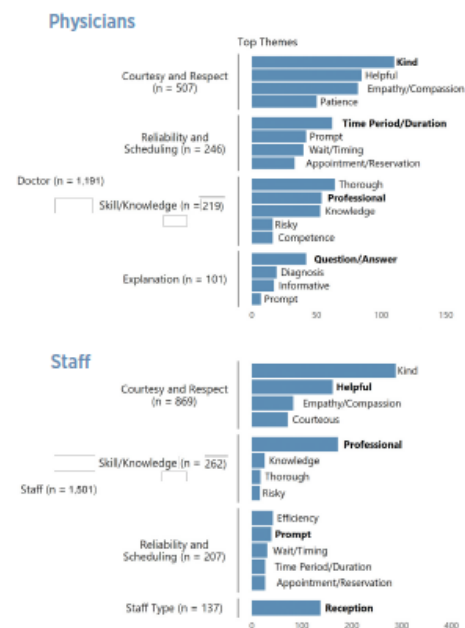

The number of comments mentioning key topics such as tests and cleanliness spiked quickly from the early days of the pandemic. Patients reported for COVID-19 positive comments.

What this tells us:

Analyzing patient comments and identifying themes provides organizational understanding and anticipating heightened patient needs and a strong communication plans to respond effectively.

Awareness and Appreciation for Caregivers

A top theme that emerged from our analyses of patients' COVID-19-related comments for providers and caregivers. In particular, patients recognize the personal face under the present circumstances.

Recommendations for Building Strong Caregiver

Share these insights with physicians and caregivers to remind them of the importance of doing during this crisis.

Educate and encourage physicians and caregivers to use the following connection with each patient at the start of every encounter.

- Make eye contact and be aware of body language.
- Introduce yourself and your role.
- Acknowledge the current situation with a core safety message.
- Always use appropriate personal protective equipment.
- Narrate all care being provided.

Concerns About Testing Delays and Cleanliness

A large number of patients' negative COVID-19-related comments mention testing delays and cleanliness. Of note, concerns about delays were mitigated when caregivers communicated to set expectations. The apparent cleanliness of the care setting and safety practices indicating patients' heightened awareness of hygiene and safety practices of personal protective equipment, and sanitizing efforts.

Tests and Treatments (n=1,914)

Cleanliness

Recommendations for Building Patient Trust

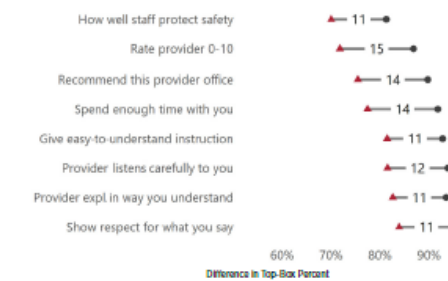

Caregivers and staff should consistently communicate with patients about likely impacts on access and timing of treatment. Providers and health systems experiencing capacity challenges related to COVID-19 likely impacts on access and timing of treatment.

- Caregivers and staff should practice Universal Reliability Skills for check-in.
- Encourage and affirm safe behaviors such as handwashing and social distancing.
- Discourage and correct unsafe behaviors such as shaking hands.
- Narrate all care being provided.

Impact on Patients' Rating of Experience

Patients with COVID-19 comments in their survey responses were more likely to rate many other areas of care lower than those who did not mention COVID-19. Although these analyses are based on surveys completed during the first wave of the pandemic, the observed rating differences are significant for all of the measures shown.

Medical Practice

Emergency Department

Communication and Transparency: Meeting Needs Today to Build Enduring Trust

Extended periods of uncertainty give rise to unanticipated needs and anxiety. The nature of the coronavirus pandemic has led patients and caregivers to look to health systems and their leaders for reassurance. Patients and families respect the commitment and risk that front-line caregivers have embraced and are relying on them in this time of crisis. Understanding and meeting their needs with communication and transparency is essential. This is a critical moment and important opportunity to build unbreakable bonds of trust with patients and families that will extend long past the pandemic.

Consult Press Ganey's guide, "High-Leverage Skills: Top 3 Actions to Support Safe, Exceptional Care in Crisis Situations," on the COVID-19 resources page at pressganey.com/COVID19.

HEALTH POLICY BRIEF  WWW.HEALTHAFFAIRS.ORG 1

HealthAffairs | Robert Wood Johnson Foundation

Health Policy Brief

JULY 16, 2015

The Oregon Health Insurance Experiment. A 2008 lottery extending Medicaid to selected residents allowed for a randomized study on the impact of Medicaid coverage.

WHAT'S THE ISSUE?

One of the principal strategies contained in the Affordable Care Act (ACA) to achieve near-universal health insurance coverage is expansion of eligibility for the Medicaid program. There has been much debate about whether expansion of the Medicaid program should be used to extend health care benefits to the low-income uninsured.

This brief summarizes findings of the Oregon Health Insurance Experiment, a randomized controlled study made possible by a unique lottery process used in 2008 to expand Medicaid coverage in the state. The study addresses many of the issues being considered by policy makers, including take-up rates and characteristics of enrollees; use of health services; health outcomes and measures of well-being; enrollee finances and medical debt; as well as indirect societal effects on labor markets, private insurance coverage, and participation in other public programs.

WHAT'S THE BACKGROUND?

Medicaid, established under Title XIX of the Social Security Act (SSA), is the jointly financed federal and state program that provides comprehensive health insurance coverage to many of the poorest Americans. States must meet certain minimum federal requirements in terms of the populations that must be covered, minimum benefits, and service delivery but otherwise have flexibility to tailor their programs within federal parameters. Under section 1115 of the SSA, the secretary of health and human services (HHS) has broad authority to grant demonstration waivers that allow states to implement their Medicaid programs in ways that deviate from federal requirements, so long as the programs are determined by the agency to promote Medicaid objectives.

Prior to implementation of the ACA, in the absence of a waiver, eligibility for Medicaid was limited to individuals with limited income and assets who fell within specified categories such as children, pregnant women, parents of eligible children, and individuals with disabilities. States could not receive federal Medicaid matching funds for individuals who did not fall within one of the specified categories. Those excluded from eligibility consisted primarily of low-income nondisabled childless adults.

The Oregon Health Plan

In the late 1980s, with approximately 18 percent of Oregonians uninsured, a group of citizen activists engaged the state in a discussion of the ethics of the existing Medicaid system that granted comprehensive health benefits

©2015 Project HOPE—The People-to-People Health Foundation Inc. 10.1377/hpb.2015.10

Oregon experiment showed greater Medicaid coverage didn't necessarily reduce costs –
Implying that **changing how health care delivery** is the only avenue to cost control

NEIL

...Nor the Famous “Hot Spotting”...

The New York Times

• These Patients Are Hard to Treat

A study examined a popular approach that coordinated care for the most expensive patients, and found that the project did not reduce hospital admissions.

Cooper University Hospital in Camden, N.J. A project in the city to reduce hospital visits by addressing patients' needs outside the hospital did not produce desired results. Mel Evans/Associated Press

Once the popular theory was compared to long term control group outcomes - the results were **very disappointing**.

NEIL

...And basic hospital economics are too often overlooked... Charges are many times higher than marginal costs.

And incremental costs for avoided hospital stays are often **30-50%** of charges in the best case, depending on the type of institution you are and how volume allows nurse staffing levels to change.

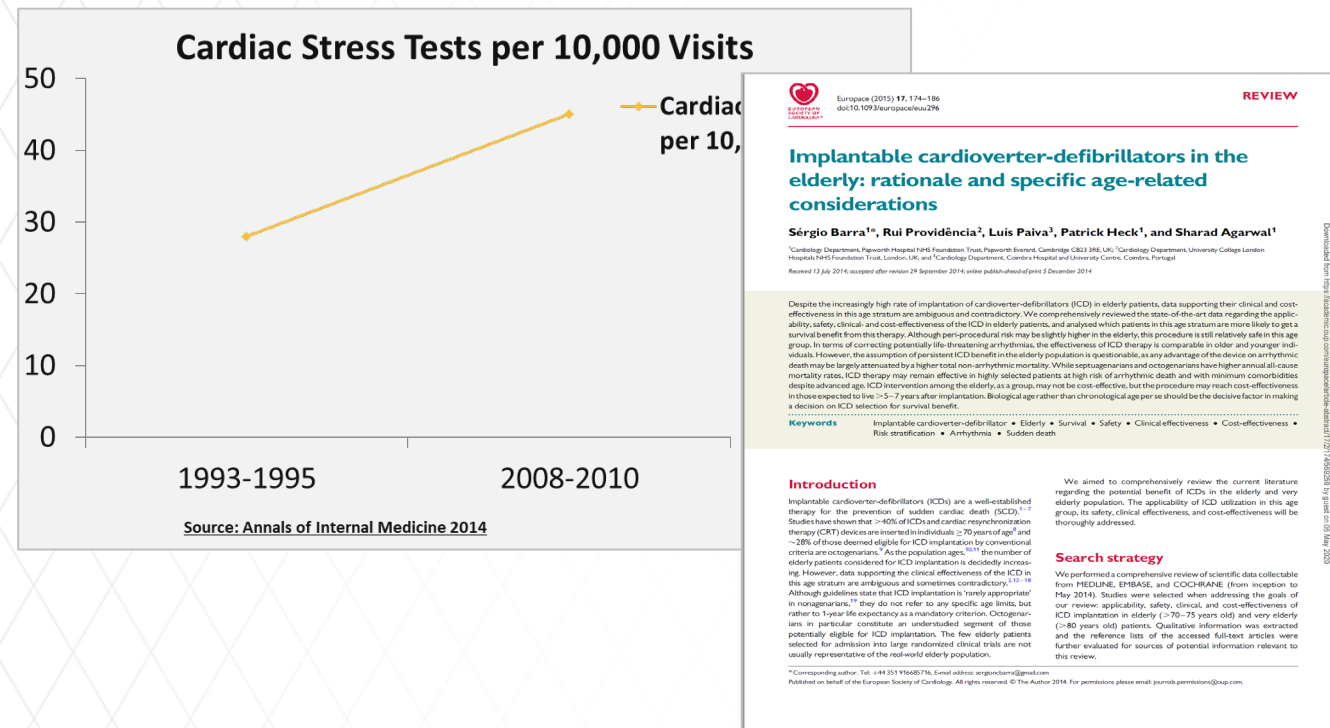

By comparing pop health interventions to marginal costs instead of charges, make many of the ROI of those projects negative.

NEIL

... Solution – Less Low Value Care and Automation

REVIEW

Implantable cardioverter-defibrillators in the elderly: rationale and specific age-related considerations

Sérgio Barra¹*, Rui Providência², Luis Paiva³, Patrick Heck¹, and Sharad Agarwal¹

*1*Cardiology Department, Papworth Hospital NHS Foundation Trust, Papworth Road, Cambridge CB3 3RS, UK; *2*Cardiology Department, University College London, Haysick NHS Foundation Trust, London, UK; and *3*Cardiology Department, Coimbra Hospital and University Center, Coimbra, Portugal

Received 13 July 2014; accepted after revision 29 September 2014; online publication of article 5 December 2014

Despite the increasingly high rate of implantation of cardioverter-defibrillators (ICD) in elderly patients, data supporting their clinical and cost-effectiveness in this age stratum are ambiguous and contradictory. We comprehensively reviewed the state-of-the-art data regarding the applicability, safety, clinical, and cost-effectiveness of the ICD in elderly patients, and analysed which patients in this age stratum are more likely to get a survival benefit from this therapy. Although peri-procedural risk may be slightly higher in the elderly, this procedure is still relatively safe in this age group. In terms of correcting potentially life-threatening arrhythmias, the effectiveness of ICD therapy is comparable in older and younger individuals. However, the assumption of persistent ICD benefit in the elderly population is questionable, as any advantage of the device on arrhythmic death may be largely offset by a higher total non-arrhythmic mortality. While septogenarians and octogenarians have higher annual all-cause mortality rates, ICD therapy may remain effective in highly selected patients at high risk of arrhythmic death and with minimum comorbidities despite advanced age. ICD intervention among the elderly as a group may not be cost-effective, but the procedure may reach cost-effectiveness in those expected to live > 5–7 years after implantation. Biological age rather than chronological age per se should be the decisive factor in making a decision on ICD selection for survival benefit.

Keywords: Implantable cardioverter-defibrillator • Elderly • Survival • Safety • Clinical effectiveness • Cost-effectiveness • Risk stratification • Arrhythmia • Sudden death

Introduction

Implantable cardioverter-defibrillators (ICDs) are a well-established therapy for the prevention of sudden cardiac death (SCD).^{1–3} Studies have shown that ~40% of ICDs and cardiac resynchronization therapy (CRT) devices are inserted in individuals > 70 years of age and ~28% of those deemed eligible for ICD implantation by conventional criteria are octogenarians.⁴ As the population ages,^{5,6} the number of elderly patients considered for ICD implantation is decidedly increasing. However, data supporting the clinical effectiveness of the ICD in this age stratum are ambiguous and sometimes contradictory.^{7–10} Although guidelines state that ICD implantation is ‘‘fairly appropriate’’ in nonagenarians,¹¹ they do not refer to any specific age limits, but rather to 1-year life expectancy as a mandatory criterion. Octogenarians in particular constitute an understudied segment of those potentially eligible for ICD implantation. The few elderly patients selected for admission into large randomized clinical trials are not usually representative of the real-world elderly population.

We aimed to comprehensively review the current literature regarding the potential benefit of ICDs in the elderly and very elderly population. The applicability of ICD utilization in this age group, its safety, clinical effectiveness, and cost-effectiveness will be thoroughly addressed.

Search strategy

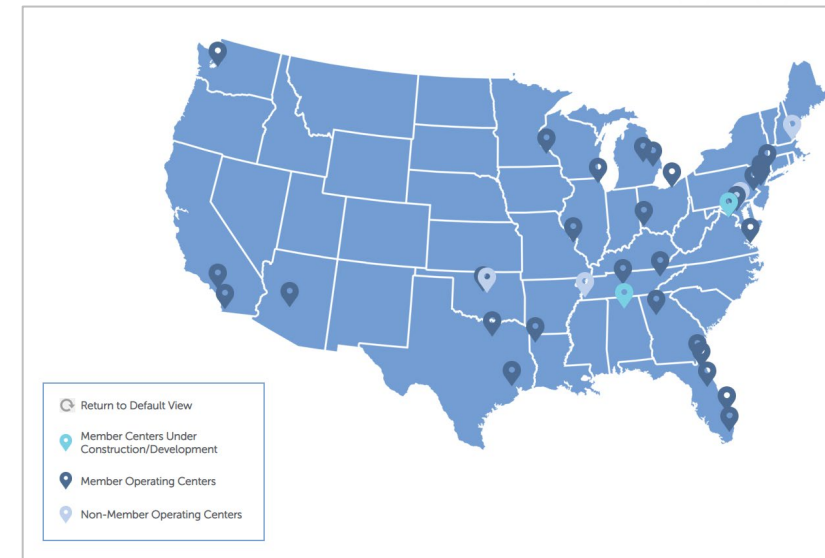

We performed a comprehensive review of scientific data collectable from MEDLINE, EMBASE, and COCHRANE (from inception to May 2014). Studies were selected when addressing the goals of our review: applicability, safety, clinical, and cost-effectiveness of ICD implantation in elderly (>70–75 years old) and very elderly (>80 years old) patients. Qualitative information was extracted and the reference lists of the accessed full-text articles were further evaluated for sources of potential information relevant to this review.

Cancer

Map of Proton Therapy Centers in the U.S. (The National Association for Proton Therapy)

Case study 2: Proton beam therapy

- Initially used for rare adult and pediatric cancers, but now also used for more common cancers
- Lack of evidence that it offers a clinical advantage over alternative treatments for common cancers
- Rapid growth in number of proton beam centers
- Medicare payment rates for proton beam much higher than other types of radiation therapy
- Medicare has few coverage restrictions
- Medicare volume and spending more than doubled from 2010-2016
 - Spending increased from \$47 million to \$115 million

Health Information Technology	-	\$89,879* *Average National Health IT Salary	Strong Healthcare Systems & Academic Research Institutions	Cluster not yet formed, decentralized industry	Strong industry outlook & highly developed local resources

FADY

Health Driven Regional Planning

Baylor, Texas A&M, UT, M.D. Anderson: Texas Medical Center

MIT, Harvard and MGH: Kendall Square

Children's National Pediatric Innovation District

- Align AMCs with firms, startups, spin-offs
- Attract national/global top talent
- Collaboration between major corporations and academic medical centers
- Engine for economic opportunity

- Multi-year evolution across multiple neighborhoods
- Mixed-use development, "Anchor plus"
- Labs, restaurants, retail, commercial
- Reversed land covenants to for-profit

"Our focus...includes a deep and historic understanding of what we call the 'power of proximity' to address pressing global challenges"

Israel Ruiz, MIT Executive Vice President and Treasurer
